

## Bipol Wifi application

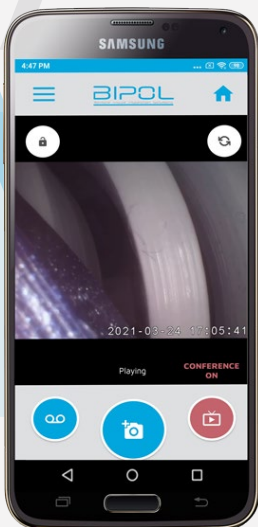

The **PRO C HD** has a built-in Wi-Fi module, which allows multi-screen viewing of the image via our **Bipol Camera App**, compatible with any ANDROID tablet or smartphone.

The application was developed to connect the user's device (tablet, smartphone) directly to the videoscope which contains the Wi-Fi module. Then, the connection remains **local, secured**, and is not accessible unless the user has access to the password.

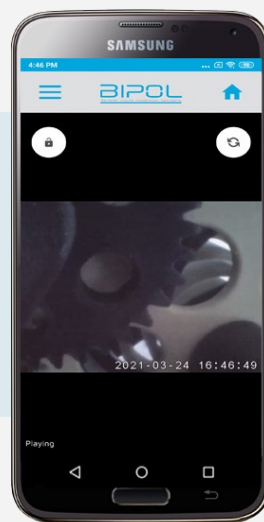

This is especially interesting for inspection areas where the Internet connection is not available.

## Easy to use

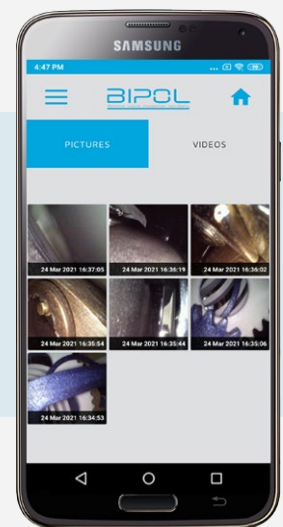

**Camera mode** allows you to follow an inspection in progress on a larger screen. This provides working comfort and greater freedom of movement.

+ : Use the videoscope with your phone: take photos, start a video recording or conference mode.

**Conference mode** allows you to share a live inspection with 10 people.

+ : Give your colleagues the opportunity to follow a live inspection.

Accessing the videoscope's **SD card** from your device allows you to view recorded photos and videos.

+ : Download photos and videos to your device directly from the SD card, in 1 click! You will be able to rename or annotate them if necessary.
